

The answer of project one:

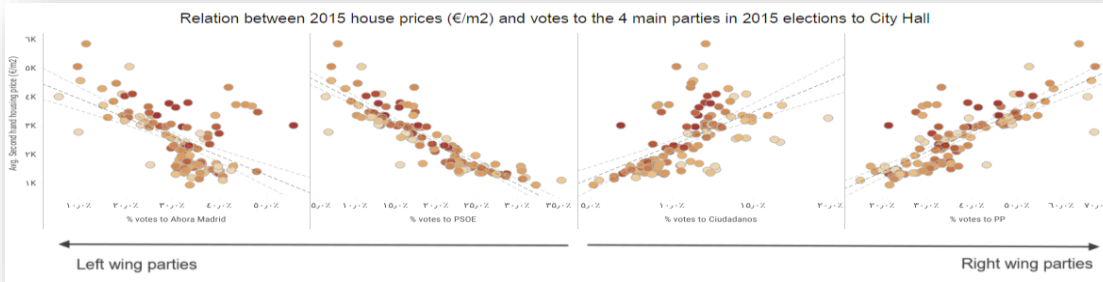

I used this title which is Madrid in Detail. After saw the pictures and read the article, I can say:

The pyramid of population here appears: in the beginning the numbers of men exceed women, but after that they are equal.

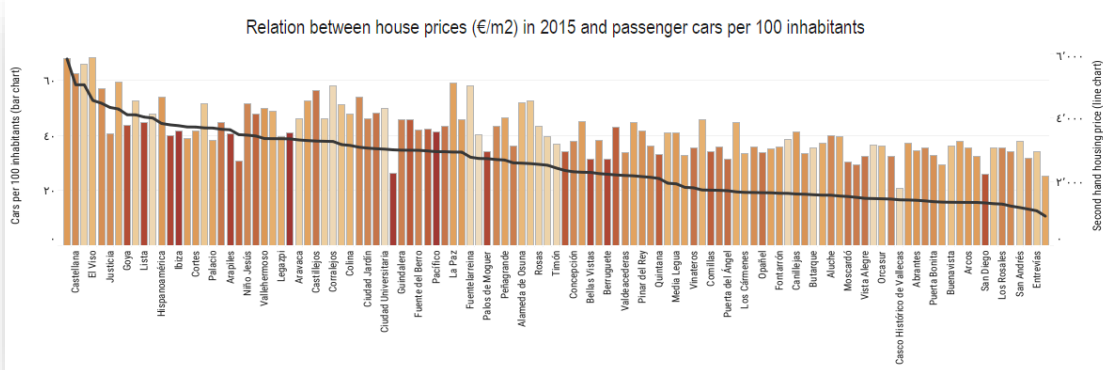

If we notice the opposite of the first picture, the numbers of men and women are equal and also the population distribution is more.

The lift wing parties appears: if the price increase ,the votes decrease. But the another side is the opposite.

In terms the most fluctuation of the spread towards the line are: Ahora madrid and PP. then Ciudadanos and finally , PSOE.

The relation between houses prices and passenger cars per 100 inhabitants in Castellana and E viso is more increase ,but more decrease in Casco It istorico de vallencas.
